**Abstract**

An overview of the national Environmental Public Health Tracking Program, and its link to drinking water and public health impacts. The EPHT is a CDC initiated project involving 22 state grantees who have developed a network of state-based programs that provide access to hazard, exposure and health impact data that is standardized, indicator-based, accessible via the web. The poster or presentation will provide an overview of drinking water data, modeled well water data, and potential health impacts. Results from a cooperative project that resulted in an ‘Atlas of Modeled Well Water Contaminants in New Hampshire’ that can provide estimates of town-level arsenic concentrations will also be presented.
