[Alabama WQ Website -- Transmitting Real Information for Real People solving Real Problem](#)

Auburn University established a database driven internet delivery system of water related information. Since a website is a passive communication system, the target audience is a variable. Information is accessed through a relational database through which a user can access information that ranges from general to scientific, wide ranging to site specific, and simple text files to complex geospatial information.

The website has been accessed by an ever-growing populace that are located world wide. The web site also serves as the data portal for much of Alabama's geospatial data.
