## **A Psycho-Social Response to Community Water Disaster Events**

Rob Nelson

### Abstract Text:

The frequency of community water related failures is continually rising. The community response to failures such as low potable water capacity, sewer ruptures, and storm water invasion can be predicted quite accurately. This presentation examines the psychological and social interaction of elected officials, professional designers, real estate developers, and community residents in bringing together a win-win approach to community growth, property value increase, and infrastructure capacity. Engineering and psychology principles are applied in creating a workable model for success. Case studies are also presented.

### Impact Statement:
